Manage Federal Reserve Bank Relationships

Office Integrator™ converts data for WFG systems:

- Maps data from several resources, e.g., text editors, spreadsheets, databases, ACH, etc.
- Reduces errors, saves time
- Provides quick turnaround for WFG system implementation
- Available Client/Server or SaaS

Office Integrator™ is designed for institutions that need data mapping for The Weiland Financial Group, Inc.'s (WFG) systems. Office Integrator™ handles diverse input formats and converts them into a recognizable format. Office Integrator™ also eliminates the need for additional programming. Office Integrator™ simplifies cross application reformatting.

If your bank enters billing information for your commercial customers using text editors, spreadsheets, and/or databases, captured data entry files can be automatically translated into service identification numbers, description, and pricing, using Office Integrator™.

Any transposition process is typically a lengthy, repetitious and error prone operation. In some cases, staff must translate account numbers (or service codes. The mapped account numbers and transaction codes must then be key entered, with transaction volumes or charges. In this environment the hours and the errors tend to pile up.

Office Integrator™ automates this entire process. It converts a manual, error prone process from hours (or days) into minutes. It greatly reduces the possibility for error. Institutions may continue using existing data entry procedures and simply convert these data entry files into a recognized format. Internally generated files already available at your institution will be turned into information you can process in your WFG system.

Office Integrator™ offers a quick and painless transition to WFG system implementation and then serves as an intermediary. Please call 847.735.0577 for more information.
